

EASY BUS COMMUNAL

by Aidan Ghirawoo

INTRODUCTION

Easy Bus Commute Web Application is a project that was designed to improve communication between commuters and bus drivers by allowing commuters to send requests and drivers to respond in real time.

The system was built using HTML, CSS, PHP, and MySQL to create a simple and user-friendly platform. In this presentation, I will explain the features of the application, how it works, and the benefits it provides also any future improvements that could be implemented.

BENEFITS

- Improves Communication Between Commuter and Driver
- Reduces confusion and waiting time with the request feature
- Simple and easy to use
- Makes transportation management more organized and efficient
- Provides a faster and more convenient system for users

FEATURES

01.

Login and Signup- You first signup by creating your username and password and choosing your role, this is then stored in the database's tables and for better security your password is hashed before being entered into the database.

02.

Request Buses-The way this feature works is that first a commuter must request a bus and then it is stored into table called requests, and the amount of requests are sent to the driver, though it must be five or more requests before the driver can accept it and finish it.

03.

Estimated arrival-This works by checking if any drivers are counted as available in the driver table in the database if they are the page displays one estimated time if not they display another estimated time

04.

Heat Map- This is a map of the campus and it highlights where is the most crowded areas and where should u wait for bus,there is also a downloadable version for offline viewing

HOW THE SYSTEM WORKS

A Commuter and Driver Logs in and the commuter sends a request.

Driver Receives Request
Driver Accepts Request

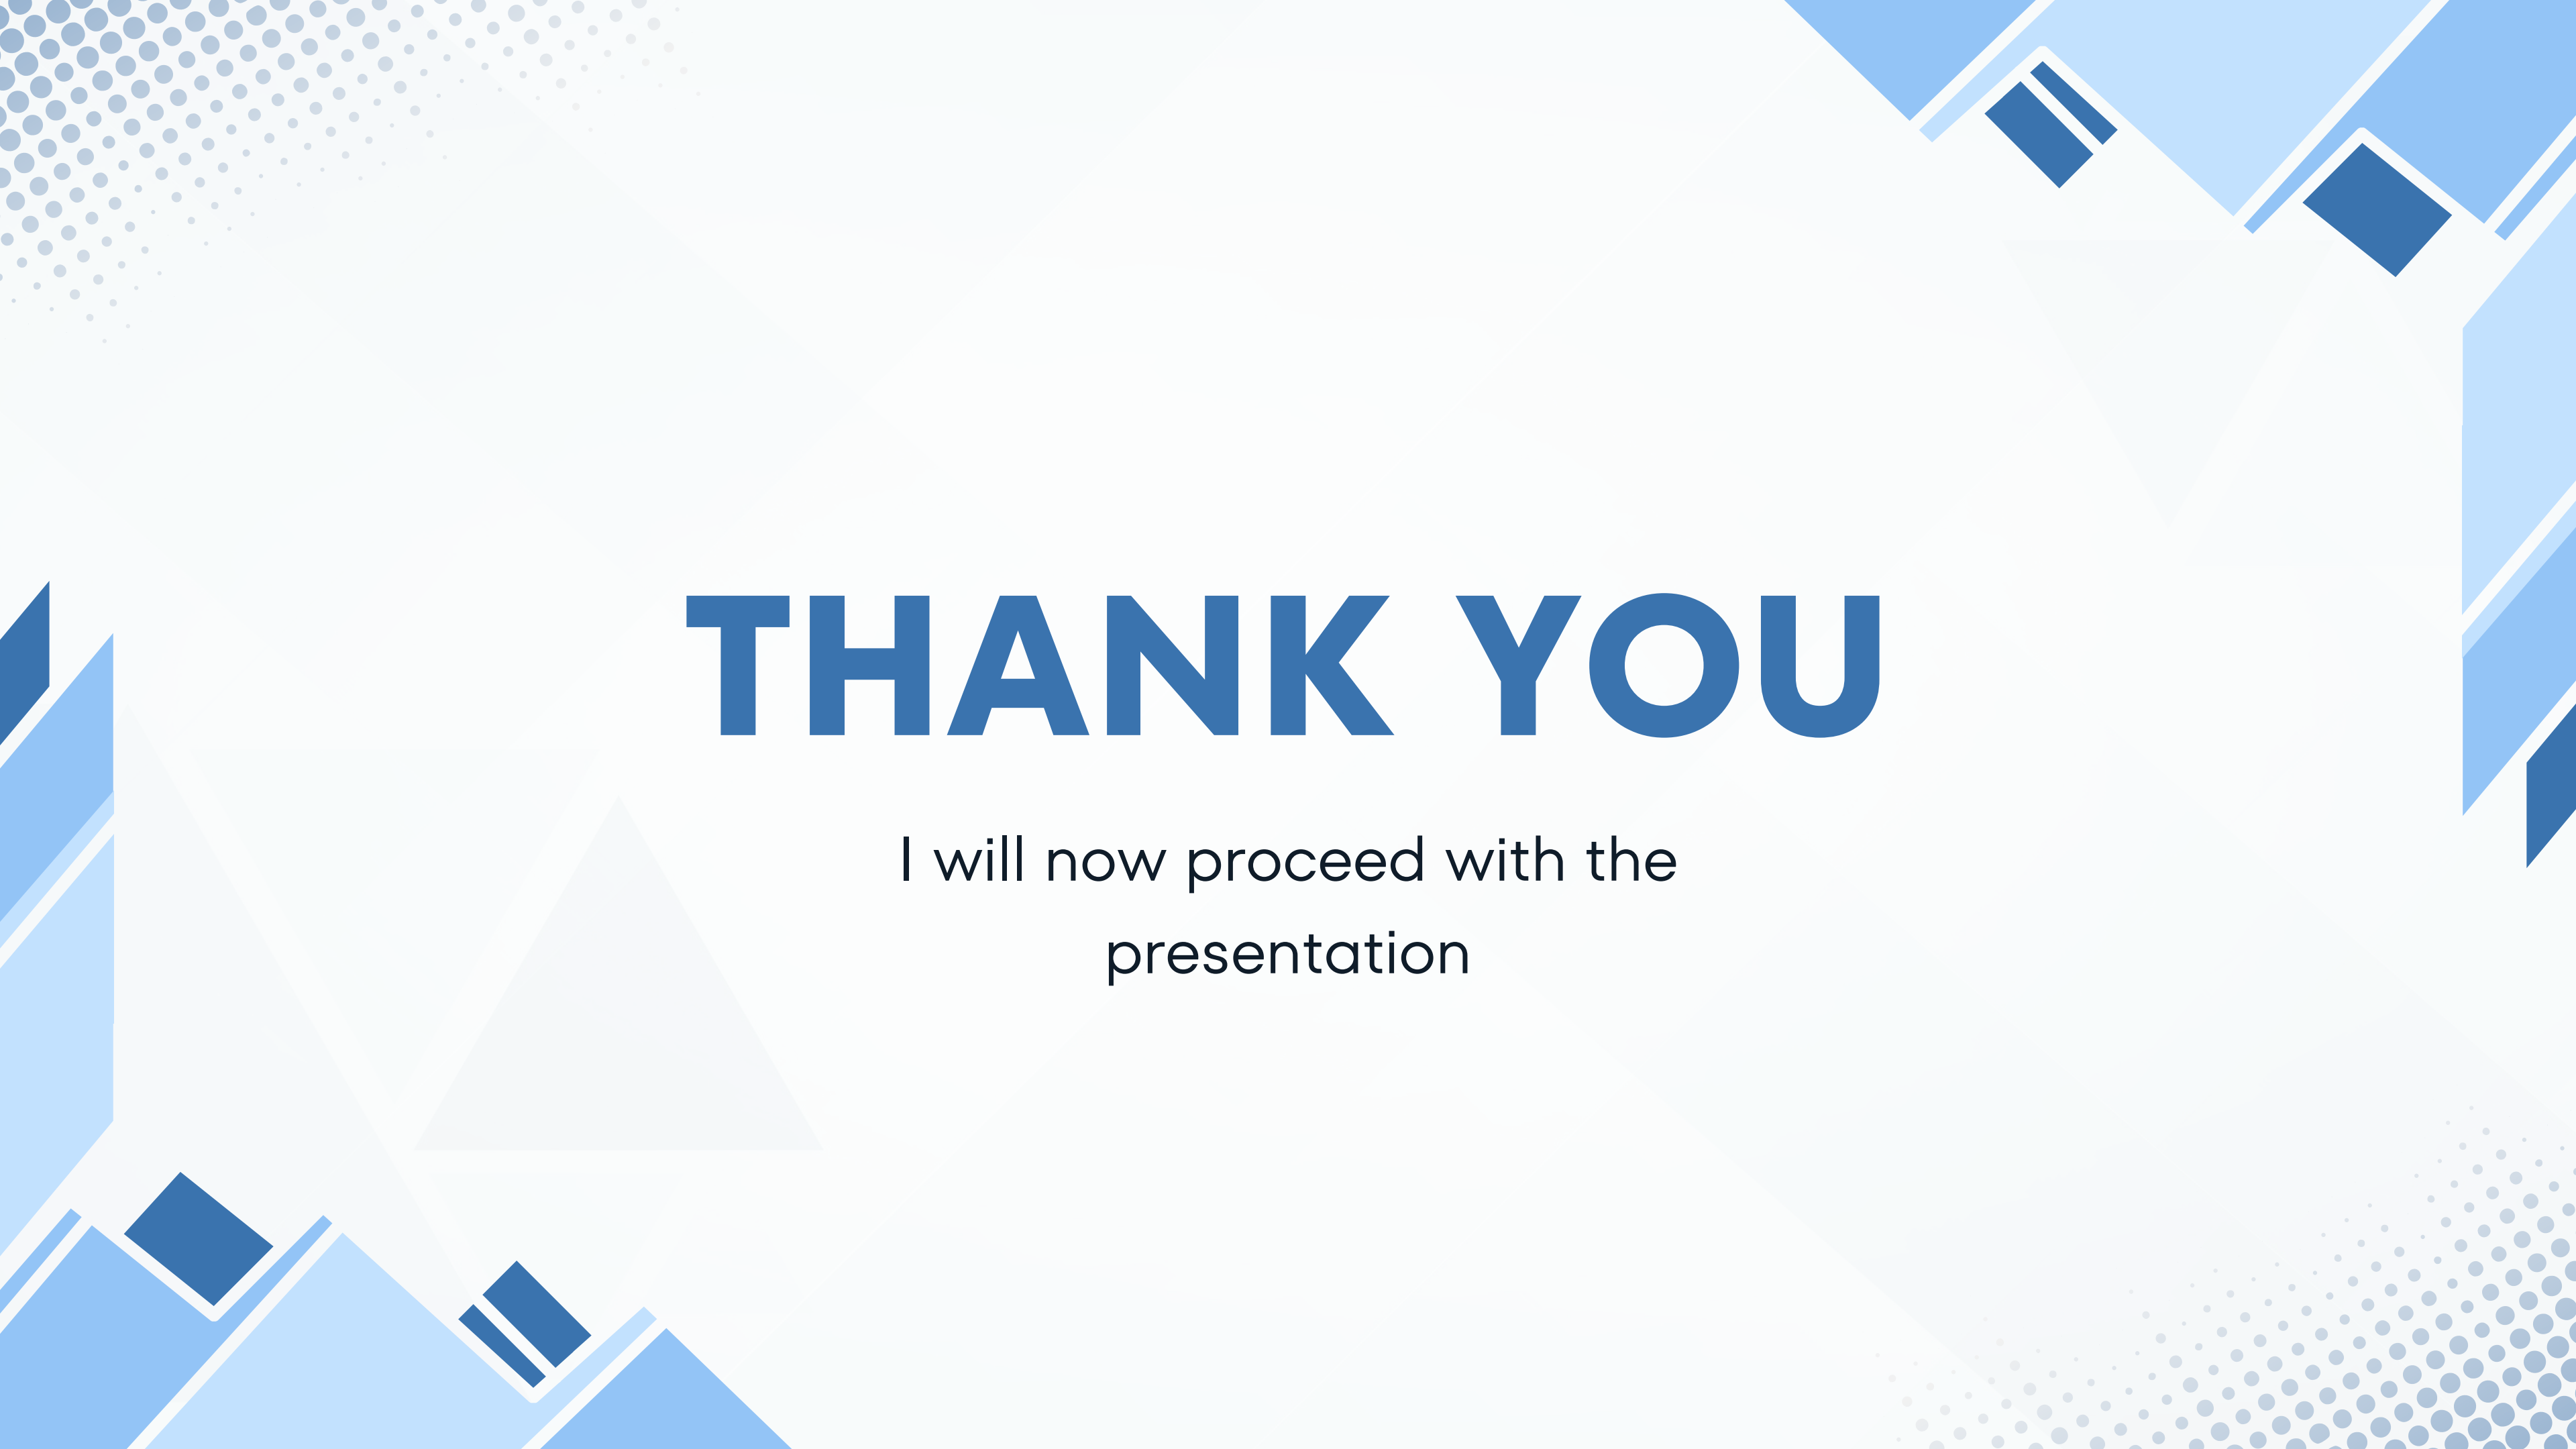

When it is done driver finishes the request

FUTURE IMPROVMENTS

- Gps Tracker
- Mobile app version
- Notifications

CONCLUSION

In conclusion, the Easy Bus Communal Web Application was successfully developed to improve communication between commuters and drivers. The system provides a simple and efficient way for users to send and manage transportation requests in real time.

THANK YOU

I will now proceed with the
presentation
